

## **4. Design**

## **4.1. Designing Databases**

# Introduction

**Figure 10-1** Systems development life cycle with design phase highlighted

10.3

# Database Design

- Database design occurs in Three stages:
  - Conceptual Design
    - Entities and their relationship are identified by analyzing input and output of the system
  - Logical Design
    - Attributes are identified
    - Primary keys are defines
    - ER diagram is used for logical representation
  - Physical Design
    - Convert ER diagram to database tables
    - Foreign keys are defined
    - Normalization

# Database Design

Features	Conceptual Design	Logical Design	Physical Design
Entity Names	✓	✓	
Entity Relationships	✓	✓	
Attributes		✓	✓
Primary Keys		✓	✓
Foreign Keys			✓
Table Names			✓
Normalization			✓

# Database Design

- Generic steps of database design are:
  - Discover and organize entities and their attributes
  - Define primary keys
  - Define the relationships between different entities
  - Create ER diagram
  - Convert ER diagram to tables using sample data
  - Normalize the tables

# Deliverables and Outcomes

- **Logical database design**

- Relations are the primary deliverable.
- Must account for every data element on a system input or output.

- **Physical database design**

- Convert relations into database tables.
- Programmers and database analysts code the definitions of the database.
- Written in Structured Query Language (SQL).

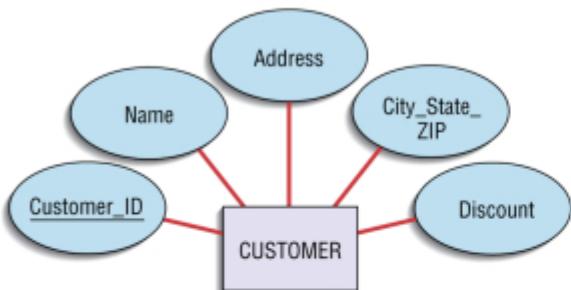

# Transforming E-R Diagrams into Relations

- It is useful to transform the conceptual data model (E-R) into normalized relations, then merge all in one final, consolidated set of relation which can be accomplished by the following steps:
  - Represent entities
  - Represent relationships
  - Normalize the relations
  - Merge the relations

# Transforming E-R Diagrams into Relations

- Represent Entities
  - Each **regular entity type** in an E-R is transformed into a relation
  - The **identifier** of the entity type becomes the **primary key** of the corresponding relation
  - The primary key must satisfy the following two conditions
    - The key should be **none-redundant**, which mean no attribute in the key can be deleted without destroying its unique identification
    - The value of the key must **uniquely identify** every row in the relation
  - The entity type label is translates into a relation name.

**Figure 9.10a** Transforming an Entity Type to a Relation — E-R Diagram

**Figure 9.10b** Transforming an Entity Type to a Relation — Relation

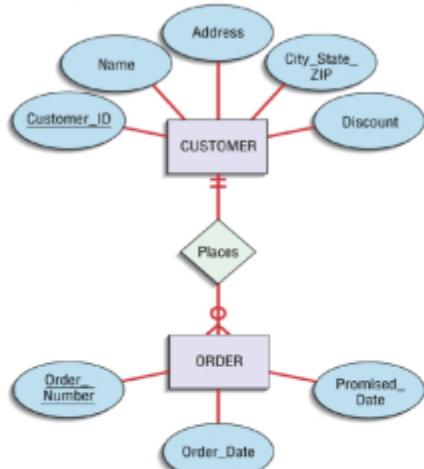

CUSTOMER

Customer_ID	Name	Address	City_State_ZIP	Discount
1273	Contemporary Designs	123 Oak St.	Austin, TX 28384	5%
6390	Casual Corner	18 Hoosier Dr.	Bloomington, IN 45821	3%

# Transforming E-R Diagrams into Relations

- Represent Relationships
- Binary 1:N Relationships
  - Add the primary key attribute (or attributes) of the entity on the one side of the relationship as a foreign key in the relation on the many side
  - The one side *migrates* to the many side, see figure 10-11 where CUSTOMER ID which it is the primary key in CUSTOMER becomes a FK to the relation ORDER
- Binary or Unary 1:1
  - Three possible options
    - Add the primary key of A as a foreign key of B
    - Add the primary key of B as a foreign key of A
    - Both of the above

**Figure 9.11a** Representing a 1:N Relationship — E-R Diagram

**Figure 9.11b** Representing a 1:N Relationship — Relations

CUSTOMER

Customer ID	Name	Address	City.State ZIP	Discount

63725	3/17/0X	4/01/0X	1273
80149	3/14/0X	3/24/0X	6390

# Transforming E-R Diagrams into Relations

- Represent Relationships (continued)
- Binary and Higher M:N relationships
  - Create another relation and include **primary keys** of all relations as **primary key (composite)** of new relation
- Unary 1:N Relationships
  - Relationship between instances of a single entity type
  - Utilize a recursive foreign key
    - A foreign key in a relation that references the primary key values of that same relation ex. EMPLOYEE(**emp\_id**, Name, Birthdate, **Manager\_id**)
- Unary M:N Relationships
  - Create a separate relation
  - Primary key of new relation is a composite of two attributes that both take their values from the same primary key ex. ITEM(item\_no, name, Cost) and ITEM\_BILL( item\_no, component\_id, Quantity)

**Figure 9.12a** Representing an M:N Relationship — E-R Diagram

**Figure 9.12b** Representing an M:N Relationship — Relations

ORDER

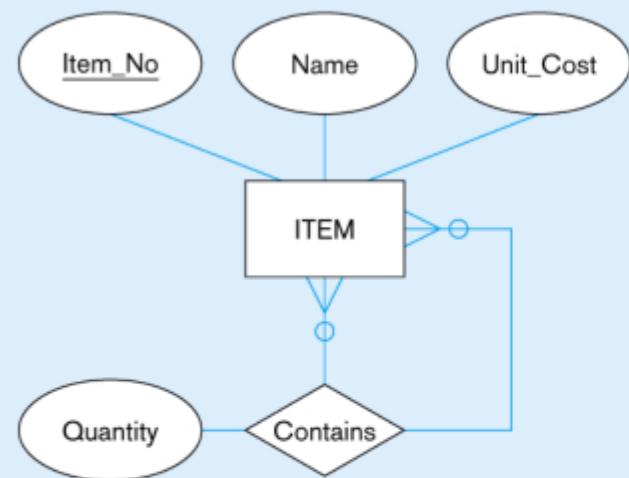

Order_Number	Order_Date	Promised_Date

61384	A261	1

PRODUCT

Product_ID	Description	(Other Attributes)
M128	Bookcase	—
A261	Wall unit	—
R149	Cabinet	—

Mapping a unary M:N relationship

# Designing Fields

- **Field**

- The smallest unit of named application data recognized by system software
- Each attribute from each relation will be represented as one or more fields

- **Choosing data types**

- **Data Type**

- A coding scheme recognized by system software for representing organizational data

- **Four objectives**

- Minimize storage space
- Represent all possible values of the field
- Improve data integrity of the field
- Support all data manipulations desired on the field

- **Calculated field:**

- a field that can be derived from other database fields. It is common for an attribute to be mathematically related to other data
- The calculate value is either stored or computed when it is requested.

# Methods of Controlling Data Integrity

- **Default Value**

- A value a field will assume unless an explicit value is entered for that field

- **Range Control**

- Limits range of values which can be entered into field

- **Referential Integrity**

- An integrity constraint specifying that the value of an attribute in one relation depends on the value of the same attribute in another relation

- **Null Value**

- A special field value, distinct from 0, blank, or any other value, that indicates that the value for the field is missing or otherwise unknown

# Database Design

- Normalization
- the process of converting complex data structures into simple, stable data structures.
  - 1 NF
    - Rule1: Each cell in a table should contain a single value
    - Rule 2: Each record must be unique
  - 2 NF
    - Rule 1: Be in 1 NF
    - Rule 2: Primary key must be single column
  - 3 NF
    - Rule 1: Be in 2 NF
    - Rule 2: There should be no transitive functional dependencies

# Database Design

- Normalization

- BCNF

- Rule 1: It should be in the **Third Normal Form**.
    - Rule 2: And, for any dependency  $A \rightarrow B$ , A should be a **super key**.

- 4 NF

- Rule 1: It should be in the **BCNF**.
    - Rule 2: the table should not have any **Multi-valued Dependency**.

- 5 NF

- Rule 1: Be in 2 NF
    - Rule 2: There should be no transitive functional dependencies

- 6 NF

- Not yet standardized

# Database Design

- Normalization: Example

Full Names	Physical Address	Movies rented	Salutation	Category
Janet Jones	First Street Plot No 4	Pirates of the Caribbean, Clash of the Titans	Ms.	Action, Action
Robert Phil	3 <sup>rd</sup> Street 34	Forgetting Sarah Marshal, Daddy's Little Girls	Mr.	Romance, Romance
Robert Phil	5 <sup>th</sup> Avenue	Clash of the Titans	Mr.	Action

Here you see Movies Rented column has multiple values, so it can be split into multiple rows to convert it to 1 NF form

# Database Design

- Normalization: Example

FULL NAMES	PHYSICAL ADDRESS	MOVIES RENTED	SALUTATION
Janet Jones	First Street Plot No 4	Pirates of the Caribbean	Ms.
Janet Jones	First Street Plot No 4	Clash of the Titans	Ms.
Robert Phil	3 <sup>rd</sup> Street 34	Forgetting Sarah Marshal	Mr.
Robert Phil	3 <sup>rd</sup> Street 34	Daddy's Little Girls	Mr.
Robert Phil	5 <sup>th</sup> Avenue	Clash of the Titans	Mr.

Above table does not still have unique identification. We can combine name and address to represent primary key.

Composite Key			
Robert Phil	3 <sup>rd</sup> Street 34	Daddy's Little Girls	Mr.
Robert Phil	5 <sup>th</sup> Avenue	Clash of the Titans	Mr.

Names are common. Hence you need name as well Address to uniquely identify a record.

# Database Design

- Normalization: Example
- Moving on to 2 NF, we must have single valued primary key
- It is clear that we can't move forward to make our simple database in 2<sup>nd</sup> Normalization form unless we partition the table above.

MEMBERSHIP ID	FULL NAMES	PHYSICAL ADDRESS	SALUTATION
1	Janet Jones	First Street Plot No 4	Ms.
2	Robert Phil	3 <sup>rd</sup> Street 34	Mr.
3	Robert Phil	5 <sup>th</sup> Avenue	Mr.

MEMBERSHIP ID	MOVIES RENTED
1	Pirates of the Caribbean
1	Clash of the Titans
2	Forgetting Sarah Marshal
2	Daddy's Little Girls
3	Clash of the Titans

# Database Design

- Normalization: Example
- To move our 2NF table into 3NF, we again need to again divide our table because we have transitive functional dependency
- Transitive Functional Dependency:
  - A transitive dependency is an indirect relationship between values in the same table that causes a functional dependency
  - Transitive dependency occurs when two or more non-key values are dependent
  - In above table, address and salutation are dependent on name

# Database Design

- Normalization: Example
- To remove the transitive dependency between name and salutation, the table can be split as below:

MEMBERSHIP ID	FULL NAMES	PHYSICAL ADDRESS	SALUTATION ID
1	Janet Jones	First Street Plot No 4	2
2	Robert Phil	3 <sup>rd</sup> Street 34	1
3	Robert Phil	5 <sup>th</sup> Avenue	1

MEMBERSHIP ID	MOVIES RENTED
1	Pirates of the Caribbean
1	Clash of the Titans
2	Forgetting Sarah Marshal
2	Daddy's Little Girls
3	Clash of the Titans

SALUTATION ID	SALUTATION
1	Mr.
2	Ms.
3	Mrs.
4	Dr.

## **4.2. Designing Forms and Reports**

## Designing Forms and Reports (Cont.)

- **Report:**

- A business document that contains only predefined data
- It is a passive document used solely for reading or viewing data.
- A report typically contains data from many unrelated records or transactions.

## Designing Forms and Reports (Cont.)

- Common Types of Reports:

- ***Scheduled***: produced at predefined time intervals for routine information needs
- ***Key-indicator***: provides summary of critical information on regular basis
- ***Exception***: highlights data outside of normal operating ranges
- ***Drill-down***: provides details behind summary of key-indicator or exception reports
- ***Ad-hoc***: responds to unplanned requests for non-routine information needs

# Process of Designing Forms and Reports

- Is a user-focused activity.
- Follows a prototyping approach.
- First steps are to gain an understanding of the intended user and task objectives by collecting initial requirements during requirements determination.

# Process of Designing Forms and Reports

- Requirements determination:

- Who will use the form or report?
- What is the purpose of the form or report?
- When is the report needed or used?
- Where does the form or report need to be delivered and used?
- How many people need to use or view the form or report?

# Process of Designing Forms and Reports

- **Prototyping**

- Initial prototype is designed from requirements.
- Users review prototype design and either accept the design or request changes.
- If changes are requested, the construction-evaluation-refinement cycle is repeated until the design is accepted.

# Process of Designing Forms and Reports

- A coding sheet is an “old” tool for designing forms and reports, usually associated with text-based forms and reports for mainframe applications.
- Visual Basic and other development tools provide computer-aided GUI form and report generation.

# Process of Designing Forms and Reports

**FIGURE 10-2**

# Process of Designing Forms and Reports

**FIGURE 10-3**

A data input screen designed in Microsoft's Visual Basic .NET  
(Source: Microsoft Corporation.)

# Deliverables and Outcomes

- Design specifications are the major deliverables and inputs to the system implementation phase.

# Deliverables and Outcomes

- Design specifications have three sections:
  - ***Narrative overview***: characterizes users, tasks, system, and environmental factors
  - ***Sample design***: image of the form (from coding sheet or form building development tool)
  - ***Testing and usability assessment***: measuring test/usability results (consistency, sufficiency, accuracy, etc.)

# Formatting Forms and Reports

- *Meaningful titles* — use clear, specific, version information, and current date
- *Meaningful information* — include only necessary information, with no need to modify
- *Balanced layout* — use adequate spacing, margins, and clear labels
- *Easy navigation system* — show how to move forward and backward, and where you are currently

Summary of account information      Clear navigation information

## Highlighting Information

- Notify users of errors in data entry or processing.
- Provide warnings regarding possible problems.
- Draw attention to keywords, commands, high-priority messages, unusual data values.

# Highlighting Information

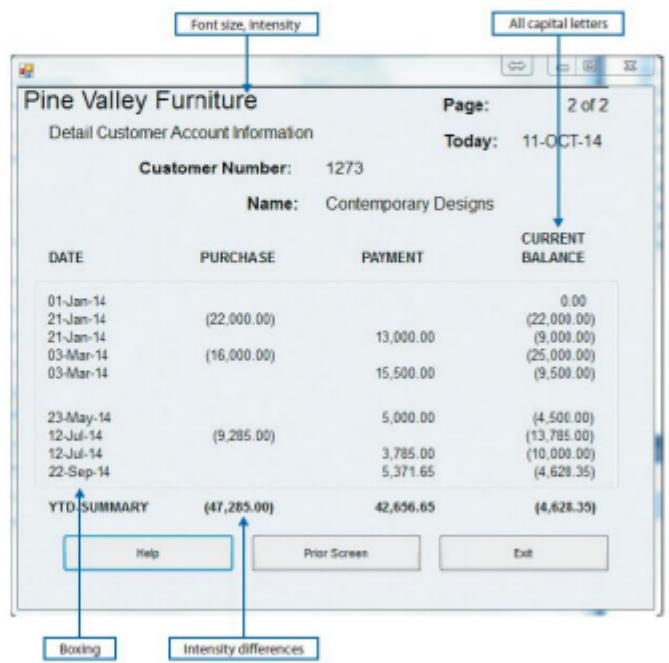

## Highlighting can include use of

- upper case
- bold
- italics
- underlining
- boxing
- size and color differences
- all capital letters
- blinking
- reverse video
- audible tones
- intensity differences
- offsetting nonstandard information

# Highlighting Information

**FIGURE 10-6**  
Customer account  
status display using  
various highlighting  
techniques  
(Pine Valley Furniture)

(Source: Microsoft  
Corporation.)

# Color vs. No Color

- Benefits — Color:

- Soothes or strikes the eye.
- Accents an uninteresting display.
- Facilitates subtle discriminations in complex displays.
- Emphasizes the logical organization of information.
- Draws attention to warnings.
- Evokes more emotional reactions.

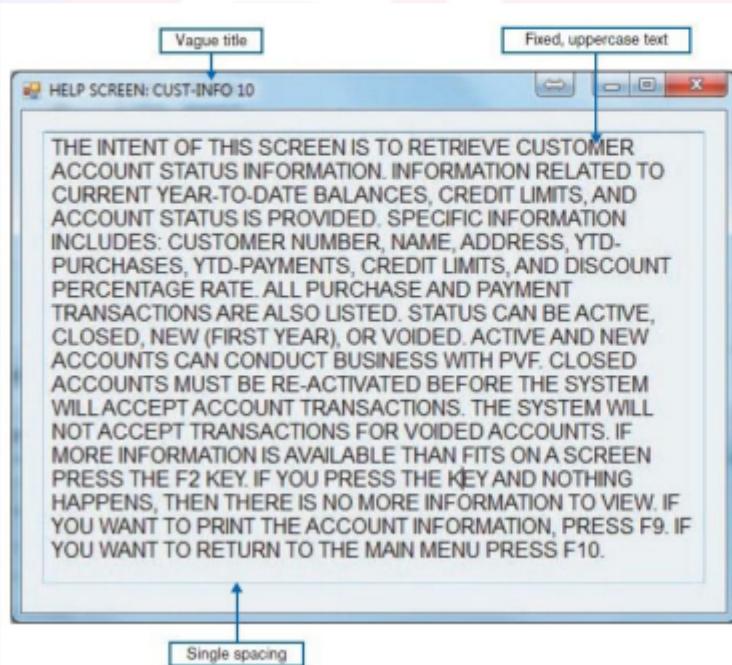

# Color vs. No Color

- Problems from Using Color
  - Color pairings may wash out or cause problems for some users.
  - Resolution may degrade with different displays.
  - Color fidelity may degrade on different displays.
  - Printing or conversion to other media may not easily translate.

## Displaying Text

- **Case:** display in mixed upper and lower case, use conventional punctuation
- **Spacing:** use double spacing if possible, otherwise blank lines between paragraphs
- **Justification:** left justify text, ragged right margins
- **Hyphenation:** don't hyphenate words between lines
- **Abbreviations:** use only when widely understood and significantly shorter than full text

# Displaying Text

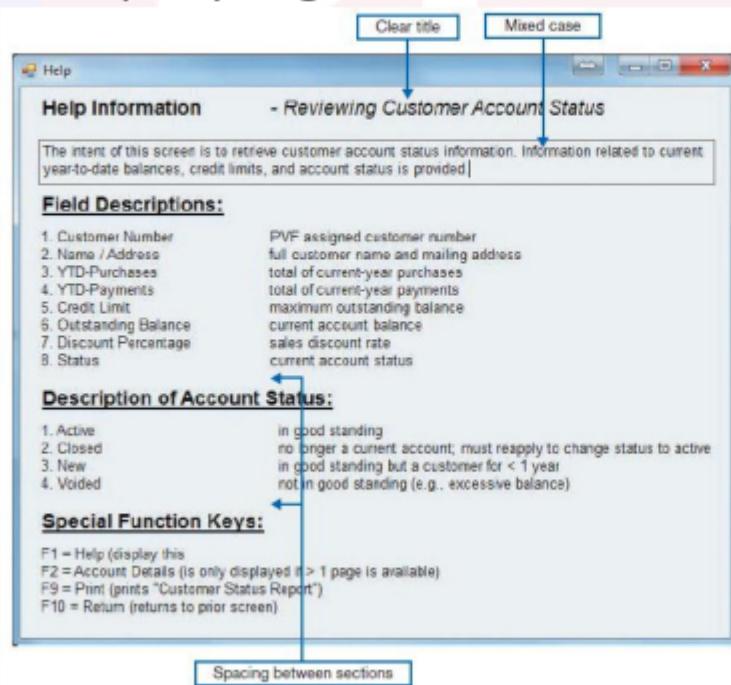

**FIGURE 10-7**

Contrasting the display of textual help information  
(Source: Microsoft Corporation.)

(a) Poorly designed help screen with many violations of the general guidelines for displaying text

# Displaying Text

**FIGURE 10-7 (continued)**

(b) An improved design for a help screen

# Designing Tables and Lists

- Labels

- All columns and rows should have meaningful labels.
- Labels should be separated from other information by using highlighting.
- Redisplay labels when the data extend beyond a single screen or page.

# Designing Tables and Lists

- **Formatting columns, rows and text:**
  - Sort in a meaningful order.
  - Place a blank line between every five rows in long columns.
  - Similar information displayed in multiple columns should be sorted vertically.
  - Columns should have at least two spaces between them.
  - Allow white space on printed reports for user to write notes.
  - Use a single typeface, except for emphasis.
  - Use same family of typefaces within and across displays and reports.
  - Avoid overly fancy fonts.

# Designing Tables and Lists

- **Formatting numeric, textual and alphanumeric data:**
  - Right justify numeric data and align columns by decimal points or other delimiter.
  - Left justify textual data. Use short line length, usually 30 to 40 characters per line.
  - Break long sequences of alphanumeric data into small groups of three to four characters each.

# Designing Tables and Lists

**FIGURE 10-8**

Contrasting the display of tables and lists (Pine Valley Furniture)  
(Source: Microsoft Corporation.)

Numeric data are right justified

## Designing Tables and Lists

- Use tables for reading individual data values.
- Use graphs for:
  - Providing quick summary.
  - Displaying trends over time.
  - Comparing points and patterns of variables.
  - Forecasting activity.
  - Simple reporting of vast quantities of information.

# Designing Tables and Lists

Pine Valley Furniture Salesperson Annual Summary Report, 2013						
January 10, 2014			Page 1 of 2			
Region	Salesperson	SSN	Quarterly Actual Sales			
			First	Second	Third	Fourth
Northwest & Mountain	Baker	999-99-9999	195,000	146,000	133,000	120,000
	Hawthorne	999-99-9999	220,000	175,000	213,000	198,000
	Hodges	999-99-9999	110,000	95,000	170,000	120,000

	Swenson	999-99-9999	110,000	98,000	100,000	90,000
New England	Brightman	999-99-9999	250,000	280,000	260,000	330,000
	Kennedy	999-99-9999	310,000	190,000	270,000	280,000

<sup>1</sup>Sales reflect July 1, 2013 – December 31, 2013.

Place meaningful labels on all columns and rows

Alphabetic text is left justified

Use a meaningful title

Box the table data to improve the appearance of the table

Superscript characters can be used to alert reader of more detailed information

Sort columns in some meaningful order (names are sorted alphabetically within region)

Long sequence of alphanumeric data is grouped into smaller segments

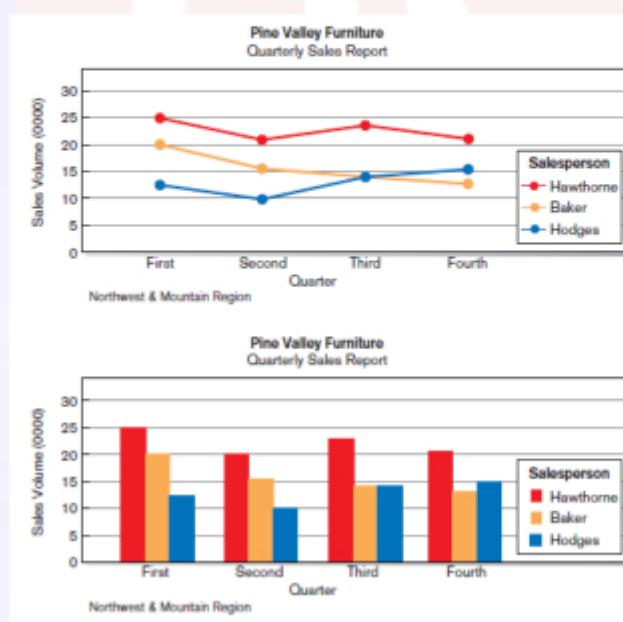

Right justify all numeric data

Try to fit table onto a single page to help in making comparisons

**FIGURE 10-9**  
Tabular report illustrating numerous design guidelines

(Pine Valley Furniture)

# Designing Tables and Lists

**FIGURE 10-10**  
Graphs for comparison

(a) Line graph

(b) Bar graph

# Assessing Usability

- Objective for designing forms, reports and all human-computer interactions is usability.
- There are three characteristics:
  - *Speed* — Can you complete a task efficiently?
  - *Accuracy* — Does the output provide what you expect?
  - *Satisfaction* — Do you like using the output?

## Assessing Usability (Cont.)

- **Usability:** an overall evaluation of how a system performs in supporting a particular user for a particular task

# Usability Success Factors

- **Consistency** — of terminology, formatting, titles, navigation, response time
- **Efficiency** — minimize required user actions
- **Ease** — self-explanatory outputs and labels
- **Format** — appropriate display of data and symbols
- **Flexibility** — maximize user options for data input according to preference

# Usability Success Factors

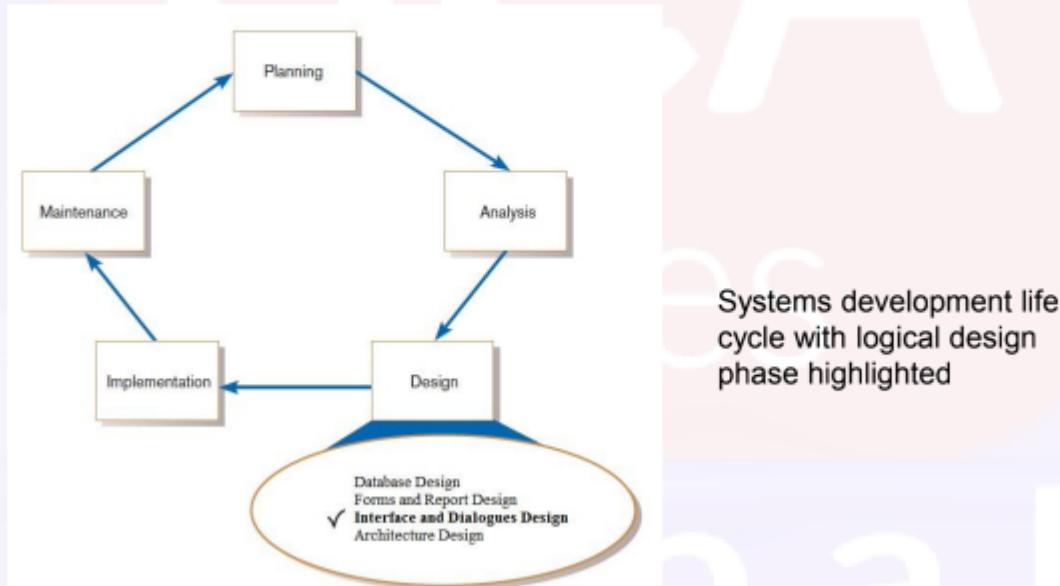

- Characteristics for consideration:
  - **User:** experience, skills, motivation, education, personality
  - **Task:** time pressure, cost of errors, work durations
  - **System:** platform
  - **Environment:** social and physical issues

## Measures of Usability

- Time to learn
- Speed of performance
- Rate of errors
- Retention over time
- Subjective satisfaction
- Consistency of layout

## **4.3. Designing Interfaces and Dialogues**

# Designing Forms and Reports

# Interface/Dialogue Design

- Layout (of widgets, text, and table data)
- Structuring data entry (tab order)
- Controlling data input (validation and format controls)
- Feedback (prompting, status, warning, and error messages)
- Dialogue sequencing

# Deliverables and Outcomes

**Figure 12-2** Specification outline for the design of interfaces and dialogues

Design Specification
<ol style="list-style-type: none"><li>1. Narrative overview<ol style="list-style-type: none"><li>a. Interface/Dialogue Name</li><li>b. User Characteristics</li><li>c. Task Characteristics</li><li>d. System Characteristics</li><li>e. Environmental Characteristics</li></ol></li><li>2. Interface/Dialogue Designs<ol style="list-style-type: none"><li>a. Form/Report Designs</li><li>b. Dialogue Sequence Diagram(s) and Narrative Description</li></ol></li><li>3. Testing and Usability Assessment<ol style="list-style-type: none"><li>a. Testing Objectives</li><li>b. Testing Results<ol style="list-style-type: none"><li>i) Time to Learn</li><li>ii) Speed of Performance</li><li>iii) Rate of Errors</li><li>iv) Retention over Time</li><li>v) User Satisfaction and Other Perceptions</li></ol></li></ol></li></ol>

# Interface Methods

- Interface: the method by which a user interacts with the information system
- Common interaction methods
  - Command line
  - Menu
  - Form
  - Object-based
  - Natural language

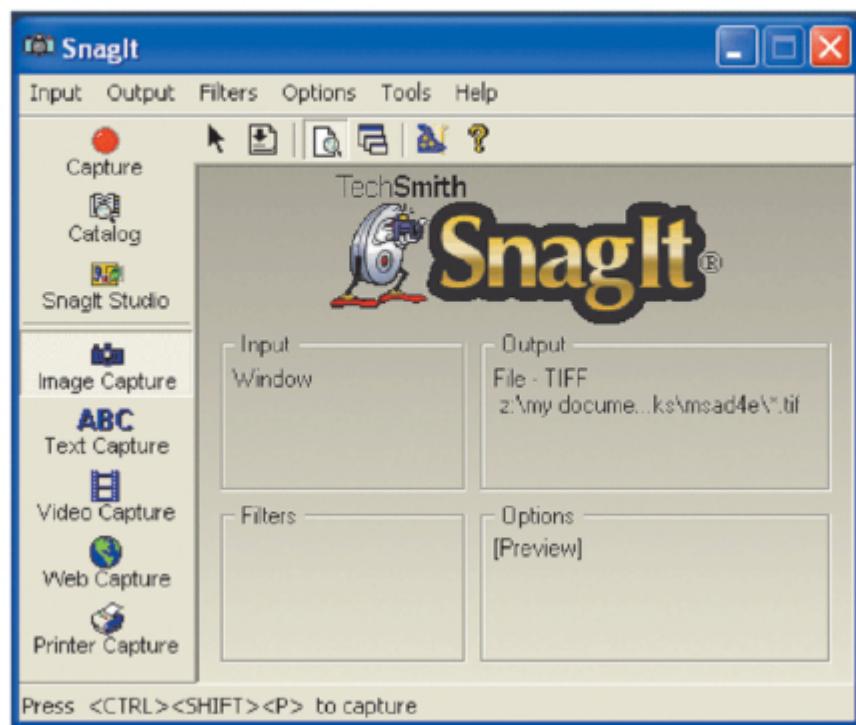

# Command Line Interaction

- Users enter explicit statements into a system to invoke operations
- Example from MS DOS:
  - COPY C:PAPER.DOC A:PAPER.DOC
  - This copies a file from the C: drive to the A: drive
- Includes keyboard shortcuts and function keys
- Experienced users and for rapid interaction with a system
- User interface standards

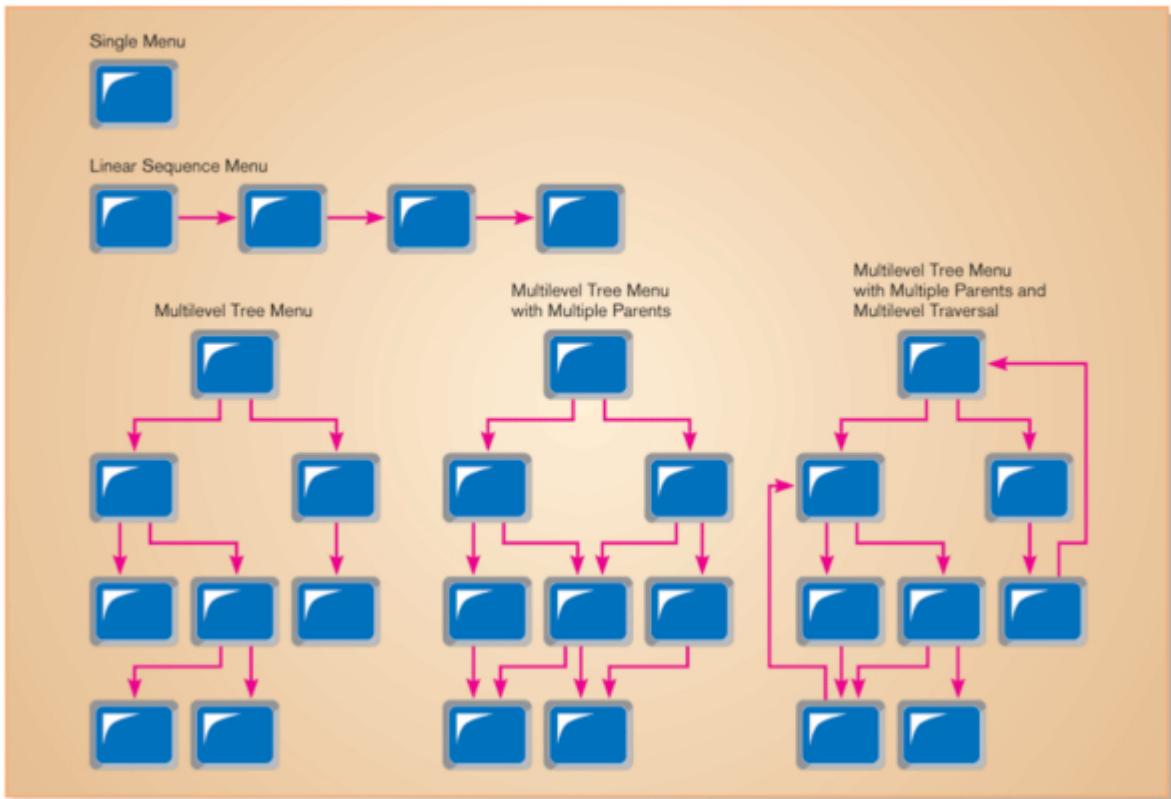

# Menu Interaction

- A list of system options is provided and specific command is invoked by user selection of a menu option
- Two common menu types:
  - Pop-up: menu placed near current cursor position
    - List of commands or possible values
  - Drop-down: access point to menu placed at top line of display, menu drops down when access point clicked

**Figure 12-4** Single-level menu (along left edge of screen) from SnagIt® by TechSmith.

**Figure 12-5** Various types of menu configurations (Adapted from Schneiderman and Plaisant, 2004)

# Guidelines for Menu Design

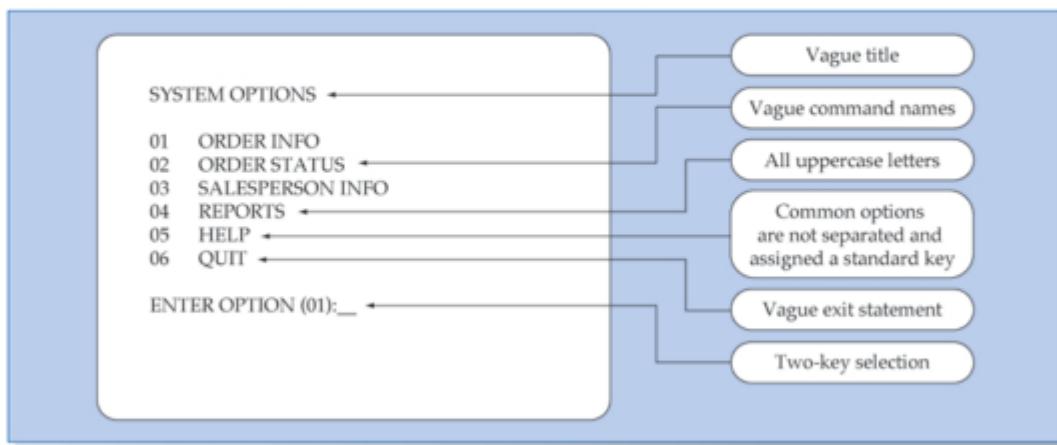

- Wording: meaningful titles, clear command verbs, mixed upper/lower case
  - Quit → prior menu or exit program?
- Organization: consistent organizing principle
  - Related options grouped together
  - Same option should have the same wording
- Length: all choices fit within screen length
  - Use submenus to break up exceedingly long menus

# Guidelines for Menu Design

- Selection: consistent, clear and easy selection methods
  - How to select and the consequences of each option – will another menu appear?
- Highlighting: only for selected options (check mark) or unavailable options (dimmed text)
- Use menu building tools

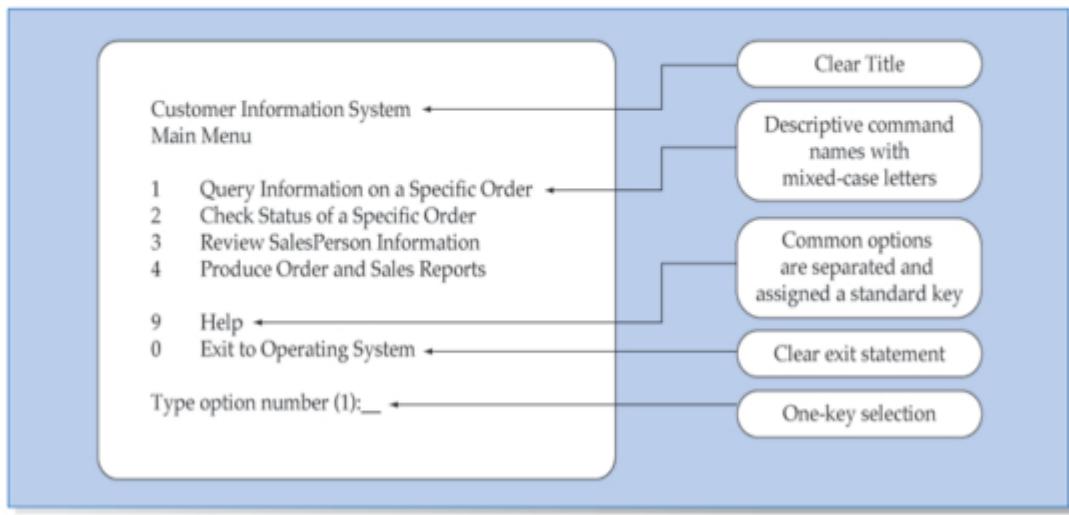

# Poor Menu Design

**Figure 12-7a** Contrasting menu designs - Poor menu design

# Good Menu Design

**Figure 12-7b** Contrasting menu designs - Improved menu design

# Form Interaction

- Allows users to fill in the blanks when working with a system
- Measures of an effective design:
  - Self-explanatory title and field headings
  - Fields organized into logical groupings
  - Distinctive boundaries
  - Default values
  - Displays appropriate field lengths
  - Minimizes the need to scroll windows

**Figure 12-9** Example of form interaction from the Google Advanced Search Engine

The screenshot shows the Google Advanced Search interface within a Microsoft Internet Explorer window. The title bar reads "Google Advanced Search - Microsoft Internet Explorer". The main content area is titled "Google Advanced Search".

**Field results:**

- with **all** of the words: [text input]
- with the **exact phrase**: [text input]
- with **at least one** of the words: [text input]
- without the words: [text input]

**Language:** any language [dropdown]  
[radio buttons] Only returns results of the file format:  
[radio buttons] Returns web pages updated in the:  
[radio buttons] Returns results where terms occur:  
[radio buttons] Returns results from the file extension:  
[radio buttons] No filtering   Filter using SafeSearch

**Products:** Find products for sale [text input] [Search] button  
To search for products, start at the [Google Product page](#).

**Page-Specific Search:**

- Similar:** Find pages similar to the page [text input] [Search] button  
e.g. [www.google.com/search.html](#)
- Links:** Find pages that link to the page [text input] [Search] button

**Topic-Specific Searches:**

- Catalog:** Search and browse mail-order catalogs online [text input] [Search] button  
Apple Macintosh - Search for all things Mac  
BSD Unix - Search web pages about the BSD operating system  
Linux - Search all linux friendly pages  
Microsoft - Search Microsoft-related pages
- U.S. Government:** Search .gov and .mil sites [text input] [Search] button  
University Standard Boxes, [BSD & more](#) - Narrow your search to a specific school's website

©2003 Google

# Object Interaction

- Symbols are used to represent commands or functions.
- Icons:
  - Graphic symbols that look like the processing option they are meant to represent
  - Use little screen space
  - Can be easily understood by users

# Natural Language Interaction

- Inputs to and outputs from system are in a conventional speaking language like English
- Based on research in artificial intelligence
- Current implementations are tedious and difficult to work with, not as viable as other interaction methods

# Hardware Options Interaction

- Keyboard
- Mouse
- Joystick
- Trackball
- Touch Screen
- Light Pen
- Voice

Make selection during  
logical design!!!

Different interfaces  
require different  
devices

# Usability Problems

- Visual Blocking: extent to which device blocks display when using
- User Fatigue: potential for fatigue over long use
- Movement Scaling: extent to which device movement translates to equivalent screen movement
- Durability: lack of durability or need for maintenance (e.g., cleaning) over extended use

# Usability Problems

- Adequate feedback: extent to which device provides adequate feedback for each operation
- Speed: cursor movement speed
- Pointing accuracy: ability to precisely direct cursor

## Usability Problems with Hardware Devices

- Visual Blocking
    - touch screen, light pen
  - User Fatigue
    - touch screen, light pen
  - Movement Scaling
    - keyboard, mouse, joystick, trackball, voice
  - Durability
    - trackball, touch screen
- 
- Adequate Feedback
    - keyboard, mouse, joystick, trackball, voice
  - Speed
    - keyboard
  - Pointing Accuracy
    - joystick, touch screen, light pen, voice

**Table 12-4** Summary of General Conclusions from Experimental Comparisons of Input Devices in Relation to Specific Task Activities

Task	Most Accurate	Shortest Positioning	Most Preferred
<b>Target Selection</b>	trackball, graphics tablet, mouse, joystick	touch screen, light pen, mouse, graphics tablet, trackball	touch screen, light pen
<b>Text Selection</b>	mouse	mouse	—
<b>Data Entry</b>	light pen	light pen	—
<b>Cursor Positioning</b>	—	light pen	—
<b>Text Correction</b>	light pen, cursor keys	light pen	light pen
<b>Menu Selection</b>	touch screen	—	keyboard, touch screen

(Source: Adapted from Blattner & Schultz, 1988.)

Key:

Target Selection = moving the cursor to select a figure or item

Text Selection = moving the cursor to select a block of text

Data Entry = entering information of any type into a system

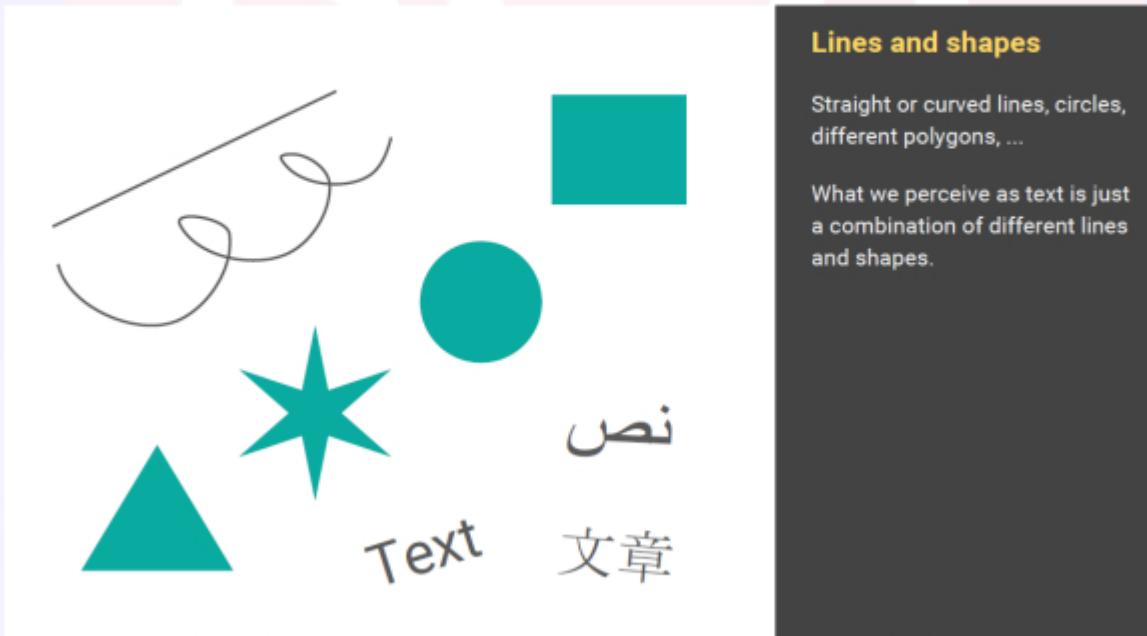

Cursor Positioning = moving the cursor to a specific position

Text Correction = moving the cursor to a location to make a text correction

Menu Selection = activating a menu item

— = no clear conclusion from the research

# Designing Interfaces: Building Blocks

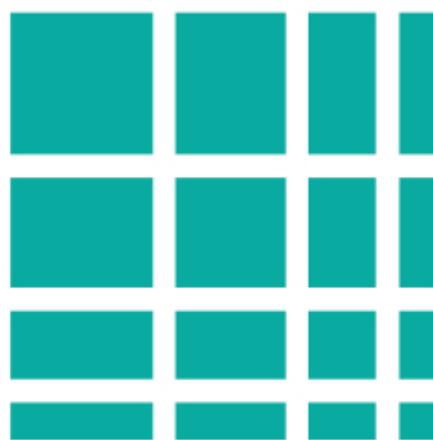

## Lines and shapes

Straight or curved lines, circles, different polygons, ...

What we perceive as text is just a combination of different lines and shapes.

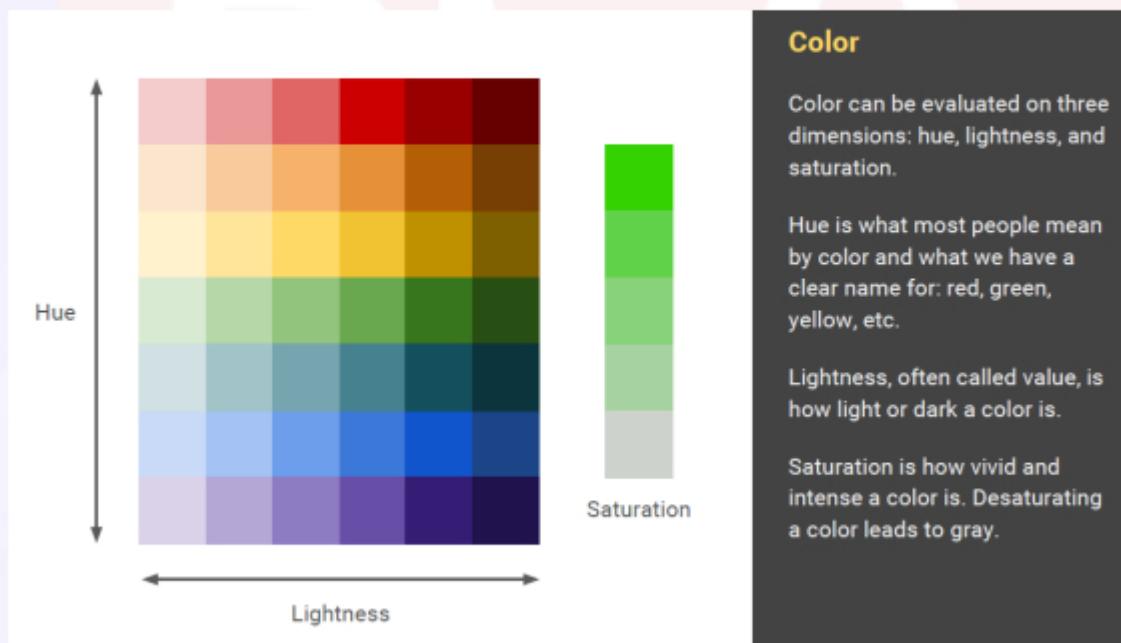

# Designing Interfaces: Building Blocks

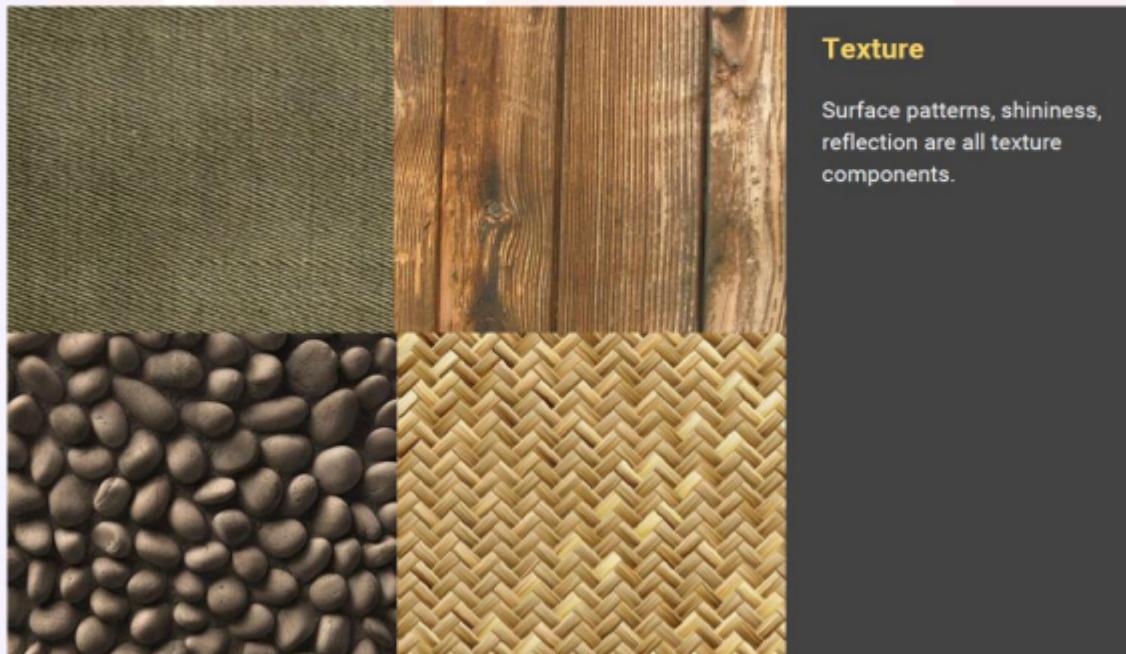

## Size

All shapes can vary in size, width and height. Lines can be thicker or thinner. We usually assign more importance to bigger things.

# Designing Interfaces: Building Blocks

# Designing Interfaces: Building Blocks

## Texture

Surface patterns, shininess, reflection are all texture components.

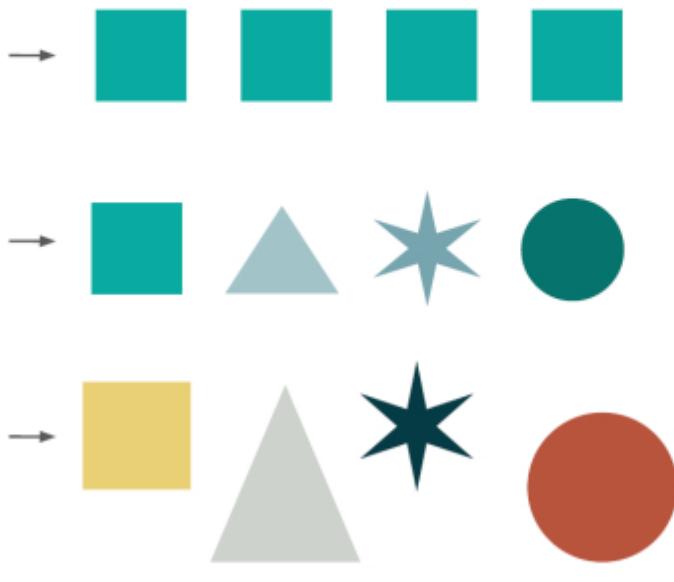

# Designing Interfaces: Basic Principles

## Balance

Saturated or dark colors and big size add weight to elements. We can use that to visually balance the page.

# Designing Interfaces: Basic Principles

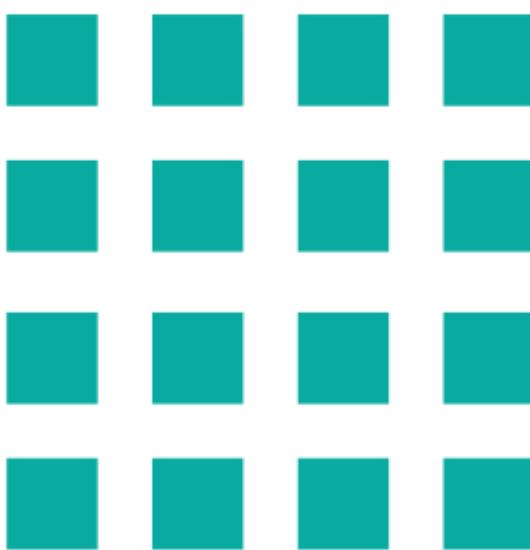

## Repetition

If similar things are repeated, we see them as belonging together; they form a group.

Repeated elements don't have to share all characteristics. But the more they do, the easier it is for us to group them.

# Designing Interfaces: Basic Principles

## Repetition

Here we see one group of sixteen elements.

# Designing Interfaces: Basic Principles

## Repetition

If we change the position of some elements, we suddenly see four groups. It's almost impossible to perceive all elements as one group, even though they are exactly the same.

# Designing Interfaces: Basic Principles

## Alignment and symmetry

Humans love alignment; it brings order. What we love even more is symmetry.

When we combine symmetry with repetition, rhythm emerges.

# Designing Interfaces: Basic Principles

This text has high contrast  
and is easy to read.

This text has low contrast  
and is harder to read.

## Contrast

Contrast shows how different  
something is from its  
surroundings.

# Feedback Messages

- **Status information:** keep user informed of what's going on, helpful when user has to wait for response
- **Prompting cues:** tell user when input is needed, and how to provide the input
  - Should be specific
- **Warning or Error:** inform user that something is wrong, either with data entry or system operation:
  - Specific, no jargon, don't scold user
  - Same format, placement

# Providing Help

- Place yourself in user's place when designing help
- Guidelines:
  - Simplicity
    - Help messages should be short and to the point
    - Use complete sentences and words that enable understanding
  - Organize
    - Information in help messages should be easily absorbed by users – bulleted or ordered list
  - Show
    - It is useful to explicitly show users how to perform an operation
- Use tools to design system help
  - HTML help environment – text editor to construct help pages that can be easily linked

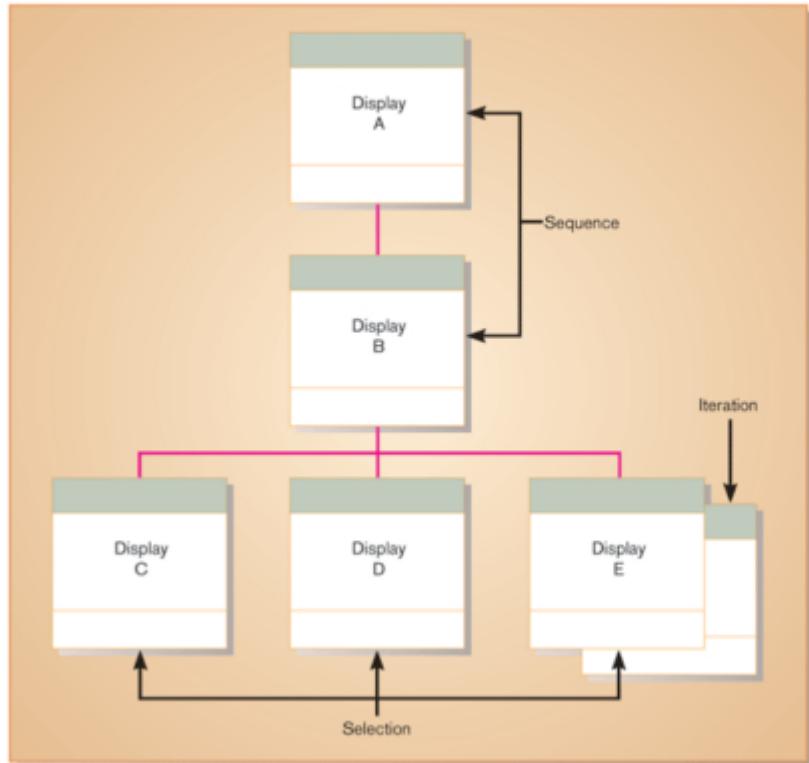

# What is a Dialogue?

- A sequence of interactions between the system and a user
- Dialogue design involves:
  - Designing a dialogue sequence
  - Building a prototype
  - Assessing usability

# Guidelines for Dialogue Design

- Consistency
  - Shortcuts and Sequence (natural)
  - Feedback for every user action (confirm add, delete)
  - Closure – there are no more screens
- Error Handling – detect, report, make suggestions
  - Reversal – undo a delete
  - Control
  - Ease of use

**Figure 12-18** Dialogue diagram illustrating sequence, selection, and iteration

Dialogue diagrams depict the sequence, conditional branching, and repetition of dialogues

## Designing Interfaces: Example

Design a **report** which is a part of a broader financial suite.

The report lists **invoices due in a given period with tax breakdown**.

It's important to mark which invoices are **overdue** and which are already **paid**.

# Designing Interfaces: Example

From: Oct 15, 2016      To: Dec 15, 2016      Generate report

Invoice	Net	Tax	Total
341230 Date issued: Sep 1, 2016 Due date: Oct 28, 2016 paid	20152.66	3425.95 17%	23578.61
341231 Date issued: Sep 13, 2016 Due date: Nov 15, 2016 overdue	412782.23	53661.69 13%	466443.92
341232 Date issued: Oct 22, 2016 Due date: Dec 13, 2016	377192.03	86754.17 23%	463946.20

**Start**

Let's start by putting all required information and controls out there. Everything we need is here, but it's hard to focus on what's the most important.

**Building block:** lines, shapes

# Designing Interfaces: Example

From: Oct 15, 2016		To: Dec 15, 2016		Generate report
Invoice 341230		Due date	Net	Tax
Date issued: Sep 1, 2016		Oct 28, 2016	20152.66	3425.95
	paid			17%
Invoice 341231		Due date	Net	Tax
Date issued: Sep 13, 2016		Nov 15, 2016	412782.23	53661.69
	overdue			13%
Invoice 341232		Due date	Net	Tax
Date issued: Oct 22, 2016		Dec 13, 2016	377192.03	86754.17
				23%
				Total
				23578.61
				466443.92
				463946.20

## Spread things around

Since "due date" is important, we moved it to a dedicated column. This will make it more prominent and balance everything on the screen.

These rows look very much like a table, so let's do just that.

## Principle: balance

# Designing Interfaces: Example

From: Oct 15, 2016		To: Dec 15, 2016	Generate report	
Invoice ID and date issued	Due date	Net	Tax	Total
Invoice 341230 Sep 1, 2016	Oct 28, 2016 paid	20152.66	3425.95 17%	23578.61
Invoice 341231 Sep 13, 2016	Nov 15, 2016 overdue	412782.23	53661.69 13%	466443.92
Invoice 341232 Oct 22, 2016	Dec 13, 2016	377192.03	86754.17 23%	463946.20

## Move to a table

Redundant labels are removed.  
A new header row is created to explain data in the table. Lines are drawn between rows to create a clear boundary.

**Building block:** line

**Principle:** grouping

# Designing Interfaces: Example

From: Oct 15, 2016      To: Dec 15, 2016      Generate report

Invoice ID and date issued	Due date	Net	Tax	Total
Invoice 341230 Sep 1, 2016	Oct 28, 2016 paid	20152.66	3425.95 17%	23578.61
Invoice 341231 Sep 13, 2016	Nov 15, 2016 overdue	412782.23	53661.69 13%	466443.92
Invoice 341232 Oct 22, 2016	Dec 13, 2016	377192.03	86754.17 23%	463946.20

## Align numbers

Numbers are much easier to scan and compare if they're aligned to the right.

Principle: alignment

# Designing Interfaces: Example

		From: Oct 15, 2016	To: Dec 15, 2016	Generate report	
Invoice ID and date issued	Due date	Net	Tax	Total	
Invoice 341230 Sep 1, 2016	Oct 28, 2016 paid	20152.66	3425.95 17%	23578.61	
Invoice 341231 Sep 13, 2016	Nov 15, 2016 overdue	412782.23	53661.69 13%	466443.92	
Invoice 341232 Oct 22, 2016	Dec 13, 2016	377192.03	86754.17 23%	463946.20	

## Create hierarchy

We need to show what information is the most important. For example, headers, issue dates, and tax percentages aren't. By decreasing them in size and changing color to gray, we decreased the contrast between them and the background. The lines between rows were also too strong and they got a similar treatment.

**Building blocks:** color, size

**Principle:** contrast

# Designing Interfaces: Example

Invoices due from  to

Invoice ID and date issued	Due date	Net	Tax	Total
Invoice 341230 Sep 1, 2016	Oct 28, 2016 paid	20152.66	3425.95 17%	23578.61
Invoice 341231 Sep 13, 2016	Nov 15, 2016 overdue	412782.23	53661.69 13%	466443.92
Invoice 341232 Oct 22, 2016	Dec 13, 2016	377192.03	86754.17 23%	463946.20

## Create hierarchy

Big buttons were towering above the table and weren't too clear. Were "From" and "To" referencing due date or date issued?

Introducing a label makes it clearer. It also looks less intense and more balanced.

**Building blocks:** lines, shapes, color, size

**Principle:** contrast

# Designing Interfaces: Example

Invoices due from <input type="text" value="Oct 15, 2016"/> to <input type="text" value="Dec 15, 2016"/>		<input type="button" value="Generate report"/>		
ID and date issued	Due date	Net	Tax	Total
341230 Sep 1, 2016	Oct 28, 2016 paid	20152.66	3425.95 17%	23578.61
341231 Sep 13, 2016	Nov 15, 2016 overdue	412782.23	53661.69 13%	466443.92
341232 Oct 22, 2016	Dec 13, 2016	377192.03	86754.17 23%	463946.20

## Remove redundancy

The first column contained too many words “invoice”. We removed them and got more space for other columns.

As a general rule, removing redundant and unnecessary elements always improves clarity and focuses on what is important.

# Designing Interfaces: Example

Invoices due from <input type="text" value="Oct 15, 2016"/> to <input type="text" value="Dec 15, 2016"/>					<input type="button" value="Generate report"/>
ID and date issued	Due date	Net	Tax	Total	
341230 Sep 1, 2016	Oct 28, 2016 paid	20,152.66	3,425.95	23,578.61	
341231 Sep 13, 2016	Nov 15, 2016 overdue	412,782.23	53,661.69	466,443.92	
341232 Oct 22, 2016	Dec 13, 2016	377,192.03	86,754.17	463,946.20	

## Group

Long numbers are hard to read. We formatted monetary values by creating groups of three digits. This makes them easy to scan and compare.

The same principle is used for grouping credit card and phone numbers.

**Principle:** grouping

# Designing Interfaces: Example

Invoices due from <input type="text" value="Oct 15, 2016"/> to <input type="text" value="Dec 15, 2016"/>		<input type="button" value="Generate report"/>		
ID and date issued	Due date	Net	Tax	Total
341230 Sep 1, 2016	Oct 28, 2016 <span>Paid</span>	20,152.66	3,425.95	23,578.61
341231 Sep 13, 2016	Nov 15, 2016 <span>Overdue</span>	412,782.23	53,661.69	466,443.92
341232 Oct 22, 2016	Dec 13, 2016	377,192.03	86,754.17 23%	463,946.20

## Highlight details

We added color to critical elements. This way they're different enough from the rest to be immediately noticeable. Even if someone has a type of color blindness that would prevent them from discerning red from green, the text and the width of "Paid" and "Overdue" labels are different enough to be recognized.

**Building blocks:** shape, color  
**Principle:** contrast

# Designing Interfaces: Example

From: Oct 15, 2016      To: Dec 15, 2016      Generate report

Invoice 341230 Date issued: Sep 1, 2016 Due date: Oct 28, 2016 paid	Net 20152.66	Tax 3425.95 17%	Total 23578.61
Invoice 341231 Date issued: Sep 13, 2016 Due date: Nov 15, 2016 overdue	Net 412782.23	Tax 53661.69 13%	Total 466443.92

---

Invoices due from  to

ID and date issued	Due date	Net	Tax	Total
341230 Sep 1, 2016	Oct 28, 2016 <small>Paid</small>	20,152.66	3,425.95 17%	23,578.61
341231 Sep 13, 2016	Nov 15, 2016 <small>Overdue</small>	412,782.23	53,661.69 13%	466,443.92

## Before and after

Each step was simple and logical; it didn't seem like a big change. But many steps together led to a complete transformation.

Visual design shouldn't look like magic anymore. It is a chain of deliberate decisions following basic principles.
